Unresectable Hepatocellular Carcinoma: Selecting the Optimal First-Line ICI Combination

Unmet Needs in Unresectable HCC

- Physicians can be confused about various frontline treatment options available to patients with unresectable HCC
- Patients with unresectable HCC do not always receive adequate frontline treatment according to the guidelines
- Lack of predictive biomarkers to select the optimal therapy for individual patients
- Lack of understanding of resistance mechanism to frontline therapy and need for continuing clinical research

Right now, we don't really have a validated biomarker that would recommend to patients which combination we should use.

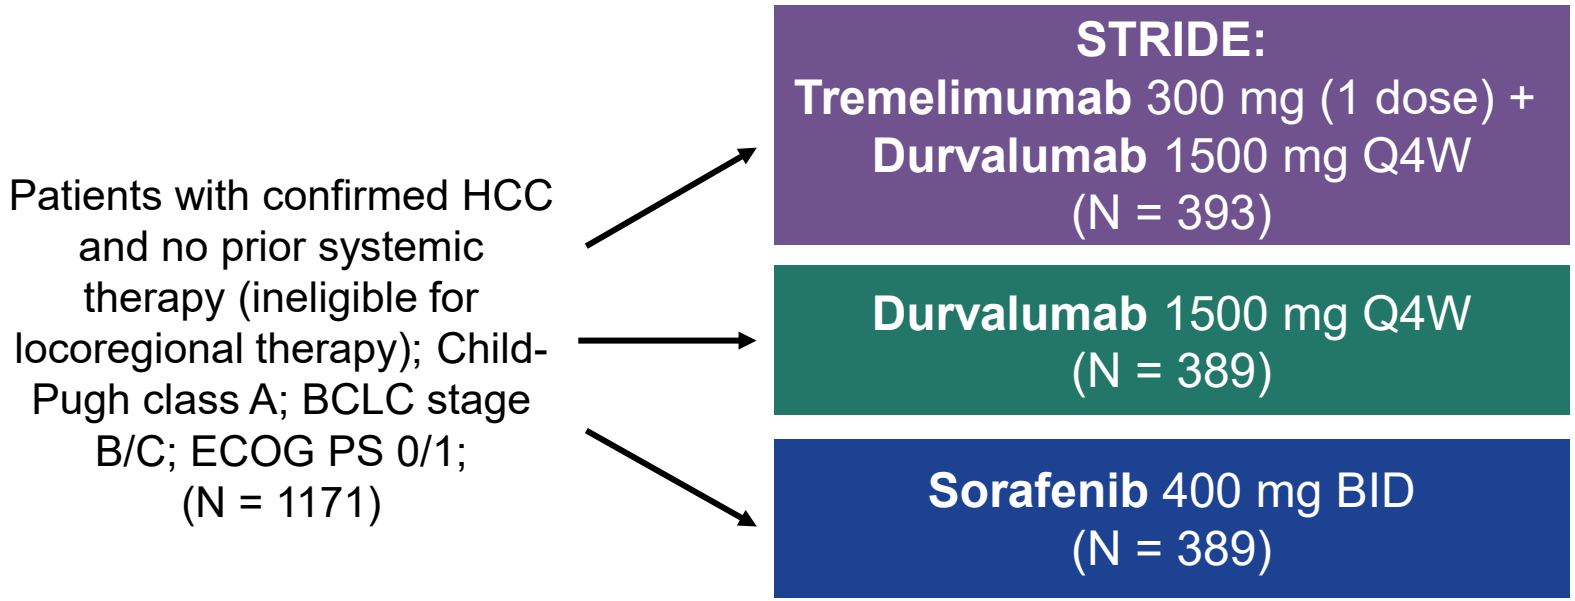
Aiwu Ruth He, MD

Checkpoint inhibitor therapies apply for everybody despite that we might see more benefit for certain populations versus the other.

Ghassan Abou-Alfa, MD

HIMALAYA: Study Design

Randomized, open-label, multicenter, global phase III trial



- **Primary endpoint:** OS (STRIDE vs sorafenib)
- **Key secondary endpoints:** OS (durvalumab vs sorafenib), PFS, ORR, safety

Abou-Alfa GK, et al. *NEJM Evid*. 2022;1(8):EVIDoa2100070.

HIMALAYA: 4-Year OS (STRIDE vs Sorafenib)

	STRIDE (*n* = 393)	Sorafenib (*n* = 389)

It's very important for our colleagues to make sure that they scope the patients before using any of the anti-VEGF therapies like bevacizumab.

Ghassan Abou-Alfa, MD

I also realize a lot of patients actually have proteinuria as a result of hypertension or diabetes. And anti-VEGF therapy may increase the risk of having worsening proteinuria.

Aiwu Ruth He, MD

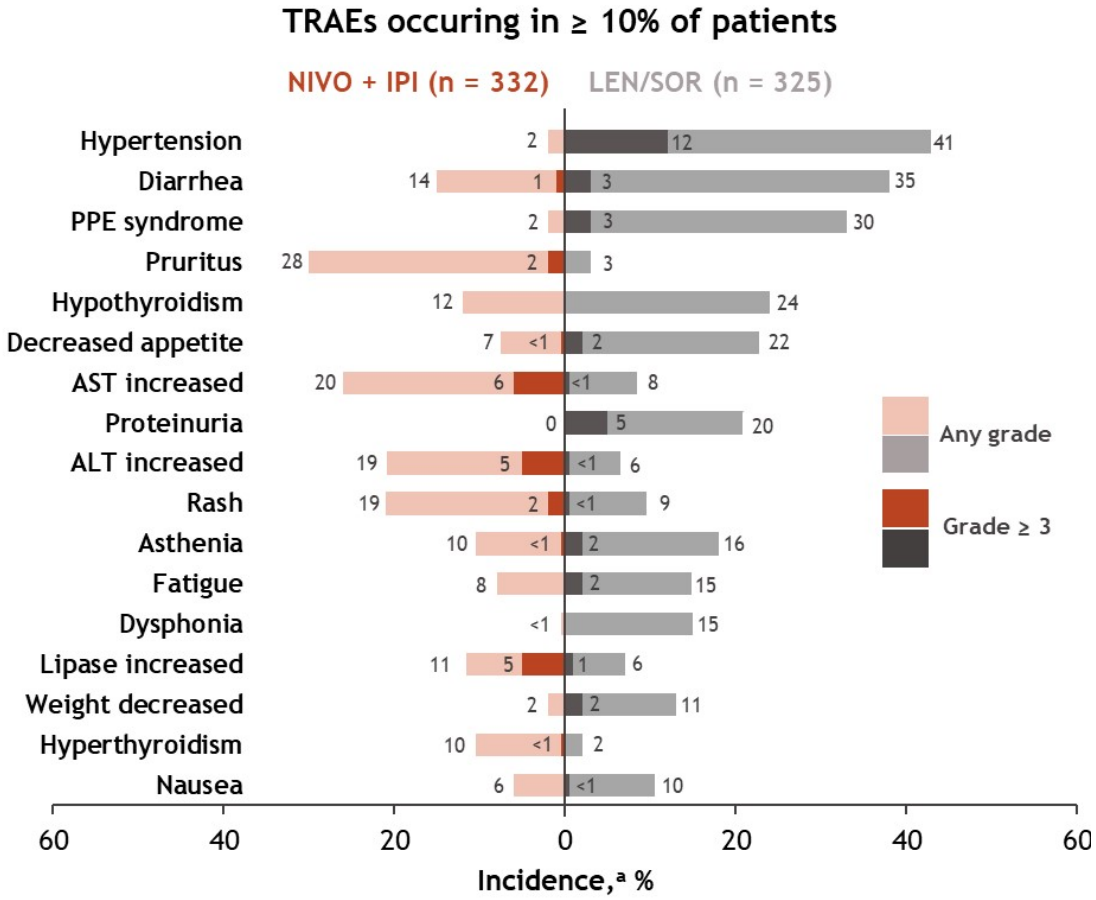
Serious TRAEs	94 (28)	83 (25)	47 (14)	42 (13)
TRAEs leading to discontinuation	59 (18)	44 (13)	34 (10)	21 (6)
Treatment-related deaths[b]	12 (4)[c]		3 (< 1)[d]	



[a]Includes events reported between first dose and 30 days after last dose of study therapy. [b]Treatment-related deaths were reported regardless of time frame. [c]TRAEs leading to death in the NIVO + IPI arm included immune-mediated hepatitis (n = 4), hepatic failure (n = 3), hepatic insufficiency (n = 1), decompensated cirrhosis (n = 1), diarrhea-colitis (n = 1), autoimmune hemolytic anemia (n = 1), and dysautonomia (n = 1). [d]TRAEs leading to death in the LEN/SOR arm included hepatorenal syndrome (n = 1), ischemic stroke (n = 1), and acute kidney injury (n = 1).

Galle P, et al. ASCO 2024. Abstract LBA4008.

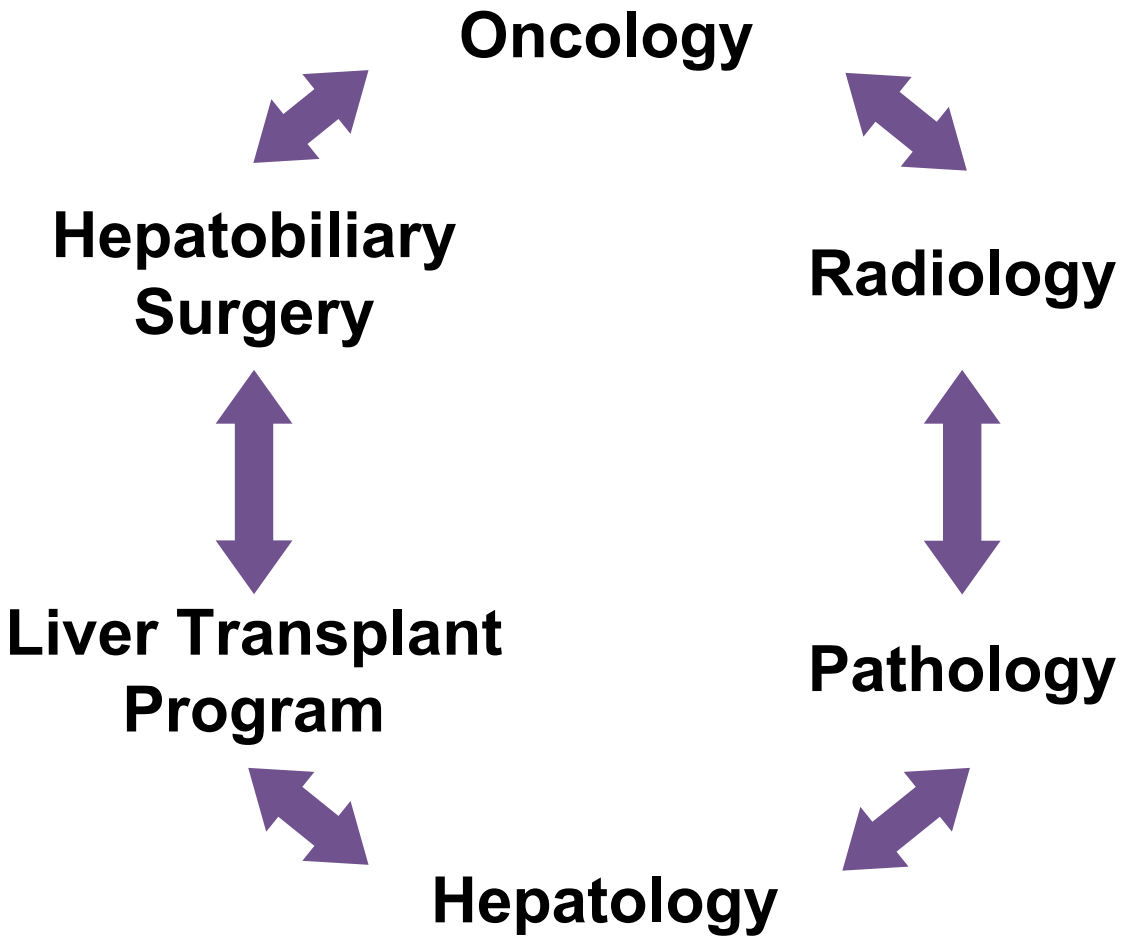
I always try to educate patients about the signs of liver failure. And we always need to watch for patients' liver function.

Aiwu Ruth He, MD

Adverse Events Associated With ICI Combinations

- Immune-mediated adverse events
  - Worsening of liver function
    - Increased ALT and AST
    - Repeat liver function test before each treatment
  - Colitis
    - Refer patients to a GI doctor
    - Treat with high-dose steroids
    - Infliximab for steroid-refractory colitis
  - Endocrine disorders
- VEGF-related adverse events
  - Risk of bleeding in patients with varices
  - Proteinuria
    - Follow up with urinalysis
    - Hold therapy if getting worse

Multidisciplinary Care for Unresectable HCC Is Important



The involvement of Medical Oncology right from the start will be very critical.

We know that it will give the opportunity to help build the big picture and ensure that we get the right therapy for the patient at the right time.

Ghassan Abou-Alfa, MD

Multidisciplinary Care Improves OS

Study	Outcomes
Single-day multidisciplinary team conference (N = 6619)[1]	Improves survival
VA hospital or multispecialty evaluation (N = 3988)[2]	Increases treatment receipt and improves survival
Single-day multidisciplinary clinic and conference (N = 355)[3]	Improves early detection, curative treatment, time to treatment, and survival
Multidisciplinary treatment team for fluid referrals and joint conferences (N = 121)[4]	Improves referrals, early detection, curative treatment, and survival

We would want to share information with patients so that they can also take part in the decision-making. I think that will increase the satisfaction of the patient.

Aiwu Ruth He, MD

It’s teamwork. We cannot engage the patients without involving and hearing the patient perspective.

Ghassan Abou-Alfa, MD

Case Presentation

- 66-year-old man with a history of cryptogenic cirrhosis diagnosed in 2016
- Monitored with routine surveillance for HCC
- A recent scan on 11/3/2023 showed LIRAD5 lesion of approximately 2.3 x 1.7 cm, bridging segments 7 and 8
- Thrombosis of the right portal vein and questionable tumor in vein
- AFP on 11/22/2023 was 2998
- WBC 3.65, Hgb 13.3, HCT 40.7, platelets 54,000
- Child-Pugh A liver function
- Normal blood pressure
- Enlarged liver and spleen
- BCLC stage C disease
